It tracks the celestial object in the sky on its orbital path of apparent movement. A programmable computer-based solar tracking device includes principles of solar tracking, solar tracking systems as well as microcontroller, microprocessor, and or PC based solar tracking control to orientate solar reflectors, solar lenses, photovoltaic panels, or other optical configurations towards the sun motorized space frames and kinematic systems ensure motion dynamics and employ drive technology and gearing principles to steer optical configurations such as Mangin parabolic, conic, or Cassegrain solar energy collectors to face the sun and follow the...

vector solar position algorithms twincat spa or psa algorithms use an astronomical algorithm to
calculate the position of the sun it uses astronomical software algorithms and equations for solar
tracking in the calculation of sun s position in the sky for each location on the earth at any time of
day like an optical solar telescope the solar position algorithm pin points the solar reflector at the
sun and locks onto the sun s position to track the sun across the sky as the sun progresses
throughout the day optical sensors such as photodiodes light dependant resistors ldr or
photoresistors are used as optical accuracy feedback devices lately we also included a section in
the book with links to microprocessor code on how the pixart wii infrared camera in the wii remote or
Wiimote may be used in infrared solar tracking applications in order to harvest free energy from the sun. Some automatic solar positioning systems use an optical means to direct the solar tracking device; these solar tracking strategies use optical tracking techniques such as a sun sensor means to direct sun rays onto a silicon or CMOS substrate to determine the x and y coordinates of the sun's position in a solar MEMS sun sensor device. Incident sunlight enters the sun sensor through a small pinhole in a mask plate where light is exposed to a silicon substrate in a web camera or camera image processing. Sun tracking and sun following means object tracking software performs multi-object tracking or moving object tracking methods in an optical object tracking technique. Image processing software performs mathematical processing to box the outline of the apparent solar disc or sun blob within the captured image frame while sun localization is performed with a center detection algorithm to determine the solar vector coordinates. An automated positioning system helps maximize the yields of solar power plants through solar tracking control to harness sun's energy. In such renewable energy systems, the solar panel positioning system uses a sun tracking technique and a solar angle calculator in positioning PV panels in photovoltaic systems and concentrated photovoltaic CPV systems automatic on-axis solar tracking in a PV solar tracking system can be dual-axis sun tracking or single-axis sun solar tracking. It is known that a motorized positioning system in a photovoltaic panel tracker increases energy yield and ensures increased power output even in a single-axis solar tracking configuration. Other applications such as robotic solar tracker or robotic solar tracking systems use robotics with artificial intelligence in the control optimization of energy yield in solar harvesting through a robotic tracking system. Automatic positioning systems in solar tracking designs are also used in other free energy generators such as concentrated solar thermal power CSP and dish Stirling systems. The sun tracking device in a solar collector in a solar concentrator or solar collector such as a solar tracker performs on-axis solar tracking a dual-axis solar tracker assists to harness energy from the sun through an optical solar collector which can be a parabolic mirror, parabolic reflector, fresnel lens or mirror array matrix. A parabolic dish or reflector is dynamically steered using a transmission system or solar tracking slew drive means in steering the dish to face the sun. The power dish actuator and actuation means in a parabolic dish system optically focusses the sun's energy on the focal point of the parabolic dish or solar concentrating system. A Stirling engine solar heat pipe, thermosyphon solar phase change material, PCM receiver or a fibre optic sunlight receiver means is located at the focal point of the solar concentrator. The dish Stirling engine configuration is referred to as a dish Stirling system or Stirling power generation system hybrid solar power systems used in combination with biogas, biofuel, petrol, ethanol, diesel, natural gas or PNG use a combination of power sources to harness and store solar energy in a storage medium. Any multitude of energy sources can be combined through the use of controllers and the energy stored in batteries phase change material, thermal heat storage and in cogeneration form converted to the required power using thermodynamic cycles. Organic Rankine Brayton cycle micro-turbine Stirling with an inverter and charge controller.
