mathematics today is approaching a state of cnsis as the demands of
science and society for mathematical literacy increase the percentage of
american college students intending to major in mathematics plummets
and achievement scores of entering college students continue thelt
unremit ting decline as research in core mathematics reaches
unprecedented heights of power and sophistication the growth of diverse
applied special ties threatens to fragment mathematics into distinct and
frequently hostile mathematical sciences these crises in mathematics
presage difficulties for science and engineering and alarms are
beginning to sound in the scientific and even in the political
communities citing a trend towards virtual scientific and techno logical
illiteracy and a shrinking of our national commitment to excel lence in
science mathematics and technology a recent study con ducted for the
president by the u s national science foundation and department of
education warns of serious impending shortcomings in public
understanding of science today people in a wide range of non scientific professions must have a greater understanding of technology than at any time in our history yet our educational system does not now provide such understanding the study goes on to conclude that present trends pose great risk of manpower shortages in the mathematical and engineering sciences the pool from which our future scientific and engineering personnel can be drawn is in danger of becoming smaller even as the need for such personnel is increasing it is time to take a serious look at mathematics tomorrow

Bringing Science and Mathematics to Life for All Learners 2008-02-19
today's undergraduate students' future leaders policymakers teachers and citizens as well as scientists and engineers will need to make important decisions based on their understanding of scientific and technological concepts; however many undergraduates in the United States do not study science, mathematics, engineering, or technology (SME) for more than one year if at all. Additionally, many of the SME courses that students take are focused on one discipline and often do not give students an understanding about how disciplines are interconnected or relevant to students' lives and society. To address these issues, the National Research Council convened a series of symposia and forums of representatives from SME educational and industrial communities. Those discussions contributed to this book, which provides six vision statements and recommendations for how to improve SME education for all undergraduates. The book addresses pre-college preparation for students in SME and the joint roles and responsibilities of faculty and administrators in arts and sciences and in schools of education to better educate teachers of K-12 mathematics, science, and technology. It suggests how colleges can improve and evaluate lower division undergraduate courses for all students, strengthen institutional infrastructures to encourage quality teaching and better prepare graduate students who will become future SME faculty.

Teaching Math, Science, and Technology in Schools Today 2014

The National Research Council (NRC) has undertaken a three-phase project to explore the possibility of a program to attract science, mathematics, and engineering PhDs to careers in K-12 education. The first phase of the project surveyed the interests of recent PhDs in science and mathematics in pursuing careers in secondary education. Analysis of the phase I data suggests that a significant percentage of PhDs might be interested in pursuing careers in secondary education under some circumstances. This
report from the second phase of the project presents a proposal for a national demonstration program to determine how one might prepare phds to be productive members of the k 12 education community the proposed program is designed to help meet the needs of the nation s schools while providing further career opportunities for recent phds in science mathematics and engineering

The mathematical sciences are part of everyday life. Modern communication, transportation, science, engineering, technology, medicine, manufacturing, security, and finance all depend on the mathematical sciences. Fueling innovation and discovery, they describe recent advances in the mathematical sciences and advances enabled by mathematical sciences research. It is geared toward general readers who would like to know more about ongoing advances in the mathematical sciences and how these advances are changing our understanding of the world, creating new technologies and transforming industries. Although the mathematical sciences are pervasive, they are often invoked without an explicit awareness of their presence.

Prepared as part of the study on the mathematical sciences in 2025, a broad assessment of the current state of the mathematical sciences in the United States, fueling innovation and discovery, presents mathematical sciences advances in an engaging way. The report describes the contributions that mathematical sciences research has made to advance our understanding of the universe and the human genome. It also explores how the mathematical sciences are contributing to healthcare and national security and the importance of mathematical knowledge and training to a range of industries such as information technology and entertainment.

Fueling innovation and discovery will be of use to policy makers, researchers, business leaders, students, and others interested in learning more about the deep connections between the mathematical sciences and every other aspect of the modern world. To function well in a technologically advanced society, every educated person should be familiar with multiple aspects of the mathematical sciences.

research and supervision in mathematics and science education provides student researchers and their supervisors with information about both the essentials of planning conducting reporting and publishing qualitative research and the characteristics of quality supervision it is focused primarily for postgraduate research students in mathematics and science education and their supervisors it will also be of interest to students and faculty in other disciplines that use educational and sociological research paradigms the volume builds on two phenomena of recent years first the increasing momentum of postgraduate research in mathematics and science education and second the resulting need of those involved for knowledge about doing research and about engaging in quality supervision the decision to address both research and supervision in one
volume is a response to the fact that faculty who supervise postgraduate research often are in need of resources covering not only aspects of project and thesis supervision but also the knowledge to assist students in research design especially in the qualitative field drawing on recent research and practice the authors of the chapters in this book illustrate approaches and strategies that have been used successfully with and by postgraduate students the book also has a strong future orientation describing how postgraduate supervision and research will change as more and more students gain access to and make use of the vast array of technological resources now available a necessary and unique addition to books in the field of postgraduate research and supervision this volume s particular appeal stems from its practical approach its creative future perspective and the wide generalizability of the thinking and ideas it presents

maths for science overturns the misconception that maths is a daunting theory filled subject by providing a confidence boosting overview of essential mathematical skills and techniques written in a clear straightforward style with examples and practice problems throughout it is the ideal guide for all science students
when young children first arrive at school they generally know how to use a mobile phone and a tablet and how to count, share and measure. They have a sense of wonder about the world around them, they expect to further interact with technology and to build and extend their mathematics and science knowledge. Teaching early years mathematics, science and ICT shows how teachers of children in their first three years of formal schooling can guide students in developing a sound understanding of the key concepts in mathematics and science in classroom and field activities. It shows how to select appropriate educational technology and effectively and routinely integrate it into the learning experience as part of students' wider classroom learning. Throughout the authors make connections between children's out of school and in school experiences as well as connections across key learning areas. They provide real classroom examples of learning experiences which can be adapted for different year levels. A reflection template assists teachers in planning and successfully implementing teaching strategies to meet curriculum requirements. Teaching early years mathematics, science and ICT helps teachers bridge theory and practice in teaching children aged five to eight years.
