this is the first in a series of three books which will for the first time ever show the distribution of europe’s more than 1500 species of millipedes on 50 x 50 km square maps the present volume includes 492 species including the tiny beautiful pincushion millipedes the colourful pill millipedes and the flat backed millipedes the millipede atlas is the result of many years meticulous accumulation of records provided by a large number of contributors from all over europe interpretation of label data from collections and scrutiny of old literature the atlas builds on the taxonomic backbone provided by the fauna europaea project which provides information on names synonyms and distribution by country or region of non marine european animals the decision to produce a series of atlases showing the distribution of myriapods in europe was taken by the participants at the fourth international congress of myriapodology held in gargnano in 1978 and soon after this the project received the full backing of the european invertebrate survey desmond kime was designated to assemble the data much help has been received from the international centre of myriapodology in paris which is acknowledged in this volume together with the contributions of many members engaged in research in this field early in the 21st century when henrik enghoff was playing a major role in fauna europaea the two authors joined forces with a view to making this millipede atlas and fauna europaea entirely compatible it is hoped that this atlas will both stimulate and be a foundation for further studies in several european countries the distribution and often the ecological requirements of millipedes are quite well understood but in many regions the information is fragmentary the maps revealing where much remains to be done there are undoubtedly many more species to discover as a result of the work already undertaken it has become apparent that millipedes are very good bioindicators being slow moving and having particular habitat requirements which are helpful in biogeographical and evolutionary studies

millipedes and moon tigers explores those uneasy places where scientific research meets public policy making and the resulting human effect on our natural and historical landscapes steve nash s eye gravitates toward those specific contemporary stories whose relevance does not diminish with a turn of the calendar s page for they represent larger looming issues the destruction wrought upon native ecosystems by invasive species such as snakehead fish the drastic and in many cases mysterious reduction in songbird populations in recent decades the blight of a century ago that wiped out four billion chestnut trees which once made up a quarter of the eastern forest nash does more than lament the passing of the continent as it once was he reveals the factors that have led to endangerment and extinction from environmental policies that are terribly outdated to technologies that are evolving more quickly than our attitudes and presents possible solutions in both the political and scientific arenas nash follows an archaeobotanist on her research in the near east to see what ancient agricultural practices in this now largely arid region can tell us about where the west may be heading he writes of civil war battlefields that in the wake of new development are being obliterated one by
one and along with them a wealth of lost archaeological opportunities turning to a more modern battlefield he writes of agroterror the intentional introduction of plant and animal diseases into agriculture and nature and suggests what might be done to stop this new threat focusing on the southeastern united states but addressing issues that affect the whole environment many of the essays explore the intersection of the environment and the most cutting edge technology nash introduces us to the minnow sized glofish america s first genetically engineered pet the animal s name is actually trademarked further advances in our understanding of molecular genetics could even result some believe in the cloning of endangered species all of this is exciting and problematic nash reports on the controversies over genetically modified pines and poplars science fiction trees and how fears of their escape into wild forests has prompted some environmentalists to go so far as to sabotage corporate laboratories the urgency nash conveys is real as one of his subjects observes it is much easier to maintain an ecosystem than repair it there is no escaping a feeling of apprehension over the destructive dynamics nash uncovers nevertheless the essays collected here stress the opportunity that is still there for policies to be established that serve humankind by better serving nature

to the entomologist all insects have six legs the layman tends to use the term insect to include the eight legged spiders and mites all these creatures are correctly classified as arthropods many thousands of the hundreds of thousands of recognised species of arthropods are found in the human environment domestic occupational and rec rional those species which are obligate parasites of man the human scabies mite and the head and body lice produce familiar clinical syndromes they remain important in medical practice and have been the subject of a great deal of recent research this is beginning to throw much light on the immunological mechanisms which largely determine the reactions of the host dr alexander has provided a detailed survey of this work the wasps bees ants and other hymenoptera which may sting man in self defence can cause painful even fatal reactions the recent work on this important subject has also been thoroughly reviewed every dermatologist of experience will admit that he sees many patients in whom he makes a diagnosis of insect bites if he has the confidence to do so or of papular urticaria or prurigo when he lacks such confidence mainly because he is at a loss to know which arthropod is likely to be implicated in his survey of the enormous literature in the entomological public health and dermatology journals dr alexander has provided an invaluable guide in which the solutions to these clinical mysteries can be sought

arthropod venoms have received much attention and have played an important role in folklore and medicine since ancient times scorpion envenomation tarant ism bee and wasp stings are among those subjects about which most has been speculated and written in the past in the last 50 years or so a great number of scientific papers have been devoted to arthropod venoms but only a few volumes have been designed to collect this rapidly increasing material and these are not recent of late the chemistry and mode of action of several arthropod venoms have been thoroughly studied and some of these substances will probably be used as pharmacological tools and also as therapeutic agents the aim of the present volume is to collect in manual form new information as well as the old notions on arthropod venoms even though it was our intention to
present a volume on arthropod venoms and not on venomous arthropods inevitably we were forced to include information on venom producing organisms as well we assumed in fact that those scientists for whom the present manual is primarily intended biochemists particularly com parative biochemists and pharmacologists should be familiar with the biologic elements concerning the venom producing species which should show them how important it is to operate in close collaboration with biologists specialized in venomous arthropod systematics and biology
