**Enteral Nutrition 2007**

Nutrition is no longer a soft science as the literature is exploding with prospective randomized trials that serve to guide clinical practice. When a critically ill patient is admitted to the intensive care unit, rapid placement of a feeding tube and initiation of early enteral feeding is one of the more important therapeutic strategies capable of actually changing clinical outcome. A key role is emerging for the nutrition support endoscopist—a physician with the skills to achieve enteral access, determine the appropriate tube, and level of infusion of formula within the gastrointestinal tract, and monitor tolerance in patients prone to ileus and pulmonary aspiration. This issue illustrates how endoscopy has revolutionized the delivery of enteral nutrition to widely disparate patient populations, establishing the means by which such nutrition support is provided while promoting safety measures to protect against potential complications.

the subject of enteral nutrition is an interesting one both to the healthcare professionals working in this practice area and to the individuals who may benefit from nutritional support. These individuals usually have functional guts but may be suffering from dysphagia with the underlying neurological deficits or the effects of radiotherapy. Treatment enteral nutrition involves the provision of nutritional support to individuals whose nutritional requirements cannot be met by a normal diet. In particular, it is the process of delivering enteral feed via feeding tubes such as nasogastric feeding, nasojejunal, and percutaneous endoscopic gastrostomy tubes. Often, enteral nutrition provision involves the assessment of nutritional status, the determination of nutritional requirements, the establishment of feeding regimes, and the management of patients using pumps, feeds, and feeding tubes. Researchers in this field are also keen to evaluate the effect of enteral feeding protocols, algorithms, and guidelines on patients with different medical conditions in various care settings. There have also been a series of comparisons between the use of feeding tubes, feeding methods, and management approaches. Economic evaluations of enteral nutrition and home enteral nutrition have teams show the benefits of home enteral tube feeding (HETF) however due to the rising cost of HETF, there has been intense debate on the subject. There have been reviews on advances, challenges, and prospects in enteral nutrition. This special issue is intended to provide information on recent advances in the area of enteral nutrition.

reaching beyond traditional nutrition support, the care of ICU patients has seen many improvements over the years both with regard to technical aspects and supportive measures. The first part of this book analyzes nutritional support at various levels ranging from the cell level to the whole body aspect. Drawing on recent prospective randomized studies, the authors propose a new approach for oral enteral and or parenteral nutrition. The second part underlines the interference between nutrition and outcome to reach recovery, giving to this field an increased importance for better short and long term management. The best glucose control, individualized nutritional support, and the avoidance of harmful interferences is extensively discussed. The final part deals with patients suffering from multi-organ failure and the need for a better understanding of the interactions between disease and nutrition.
identification of the metabolic condition of the patient existence or not of evidence based medicine expert opinion treatment opportunities and the case manager recognizing threats are all integrated to reach the appropriate decision this last part will help the reader to untangle the complexity of the icu patient of the 21st century and to propose a personalized nutritional support process

Critical Care Nutrition Therapy for Non-nutritionists 2018-02-07

The purpose of this guidelines initiative was to develop or update and validate an evidence-based feeding guideline for critically ill patients. A widely accepted methodology was adopted, which requires the identification of previously developed and validated evidence-based guidelines. The process then specifies a methodology for identifying and assimilating evidence that may be used to change or update the previously validated guidelines. An extensive literature search was conducted. Closeout date April 2003. Four hundred and sixty-five full-text papers were retrieved and reviewed. Only one evidence-based guideline for feeding critically ill patients that had been validated in an RCT was identified (Martin et al., 2004). When evaluated in a cluster-randomised trial including 499 patients from 14 hospitals, the adoption of this guideline resulted in a 10% reduction in mortality (p = 0.058) and an average decrease in hospital stay of 10 days (p = 0.003). The process and evidence used to support and update this guideline are presented in this document. The final ratified guideline was evaluated in a 27 hospital cluster-randomised trial conducted in Australia and New Zealand.
