representational and signaling roles of sound the interdisciplinary field of sonic interaction design SID challenges these prevalent approaches by considering sound as an active medium that can enable novel sensory and social experiences through interactive technologies. This book offers an overview of the emerging SID research discussing theories, methods, and practices with a focus on the multisensory aspects of sonic experience. Sonic interaction design gathers contributions from scholars, artists, and designers working at the intersections of fields ranging from electronic music to cognitive science. They offer both theoretical considerations of key themes and case studies of products and systems created for such contexts as mobile music, sensorimotor learning, rehabilitation, and gaming. The goal is not only to extend the existing research and pedagogical approaches to SID but also to foster domains of practice for sound designers, architects, interaction designers, media artists, product designers, and urban planners. Taken together, the chapters provide a foundation for a still emerging field affording a new generation of designers a fresh perspective on interactive sound as a situated and multisensory experience.
