english abstract team work is the essence for the success of any venture a multidisciplinary approach is often necessary to treat and prevent dental problems in a patient orthodontics and periodontics are interrelated in a variety of ways orthodontic treatment is based on the principle that if prolonged pressure is applied to a tooth tooth movement will occur as the bone around the tooth remodels bone is selectively removed in same areas and added in others in essence the tooth moves through the bone carrying its attachment apparatus with it as the socket of the tooth migrates since the bony response is mediated by the periodontal ligament tooth movement is primarily a periodontal ligament phenomenon orthodontic tooth movement which is the basis of the orthodontic treatment is possible because of the inherent nature of the periodontium many advances have been made in understanding the mechanisms involved in the process of tooth movement however there are many pathologic conditions affecting the periodontium which may affect these mechanisms of tooth movement and alter the end result of the orthodontic treatment similarly awareness of the pathologic changes or other undesirable changes which can occur in the periodontium as a result of ideal or less than ideal orthodontic procedures would help in better treatment procedure and management of the patients altered tooth position may affect periodontal health placement of orthodontic appliances causes microbiological changes as well as changes in the periodontium with the success in the recent decades of the fixed multi banded appliance orthodontic treatment in adults has continuously grown in the united states and europe it is in connection with adult orthodontics that periodontal factors are becoming more important to the orthodontist orthodontics in the adult patient specially the periodontally compromised patient requires adequate periodontal considerations to maintain the periodontium in a healthy condition during and after treatment minor periodontal surgery may be required to prevent relapse after orthodontic treatment in addition since periodontal diseases can secondarily cause malocclusion very often orthodontic treatment would be an essential adjunct if the periodontal therapy is to succeed

this evidence based book featuring contributions from world renowned experts discusses in detail the functional anatomy of the temporomandibular joint as well as the aetiology diagnosis treatment and medicolegal implications of patients with temporomandibular disorders tmd despite advances in our understanding of the aetiology of tmd and in developing current treatment rationales a number of issues remain controversial these include
the extent to which the temporomandibular joint should be a central focus of orthodontic diagnosis and treatment as well as the role that occlusion and malocclusion play in precipitating TMD symptoms. Indeed, few subjects in dentistry and the specialty of orthodontics are open to as many interpretations or misinterpretations as TMD. This textbook provides clinical orthodontists with essential information and guidance that will assist them in understanding and effectively managing this complex, multilayered problem. Throughout clear clinical guidelines are presented on the basis of current scientific and clinical evidence. The benefits for the professional working within a quality culture are manifold but even more important: the patient is the final arbiter of quality care. Therefore, patient-centered aspects of treatment are focused upon in this manual. A quality manual intended for European use has to respect the national regulations and European diversity and therefore needs to be flexible. The EOQM has been structured according to the treatment of the individual patient, which is what all professionals have in common and which also is the most important target for quality improvement in orthodontic practice. The EOQM is primarily designed as a stimulus for the orthodontic professional to assess and improve the quality of orthodontic care. A quality improvement system (QIS) provides support for starting and maintaining activities. The manual provides tools to systematically assess and develop quality-related actions at the individual patient treatment level and practice level. A systematic and comprehensive description of the treatment process is essential in order to provide a basis for establishing a QIS implementing a QIS will influence the provision of orthodontic care by demonstrating the potentials for development of the organisational elements of orthodontics planning and integrating systematic activities to monitor and improve treatment at the practice level and the patient.
related level orthodontic treatment process is the central element in this manual the route
taken by an individual patient is described step by step flowcharts describe the orthodontic
treatment of the individual patient step by step guidelines indicate what the professional
should do at the various steps in order to follow the generally accepted objectives of
orthodontics as described in the policy statements indicators are tools to measure the
effectiveness and efficiency of treatment the indicators provide the professional with facts
about own performance the eoqm provides the orthodontic professional with a model for
incorporating quality improvement into daily practice which is based on european orthodontic
consensus and current principles of quality in health care it can be incorporated in the quality
initiatives that are already being developed nationally and vice versa

we aimed to examine differences in treatment impacts and quality of life between adult
orthodontic patients with invisalign and fixed appliances adults represent a burgeoning branch
of orthodontics yet many prospective patients have been reluctant to pursue orthodontics due
to concerns with treatment it was hypothesized that removable aligners would be better
tolerated by adult patients sixty three adult patients forty invisalign twenty three fixed
appliances were recruited from private practice the treatment groups were largely comparable
although the braces group reported more frequent unplanned appointments and use of
auxiliaries the invisalign group experienced less negative impacts and these differences were
generally preserved after adjustment for confounding influences with the exception of pain
related impacts the invisalign group had a higher propensity to choose same modality again
while a subjective evaluation on quality of life yielded no difference between the groups the
results may guide patient education and selection of the appropriate modality

objective treatment outcome measures of many medical and dental therapies are difficult to
obtain because the detailed results of treatment are frequently not well documented
fortunately orthodontics is somewhat unique in that orthodontists record the result of their
treatment with a variety of diagnostic records that include study casts photographs
radiographs and measures that evaluate the important elements of treatment outcomes the
aim of this retrospective study was to use the par index to assess the orthodontic treatment
outcomes in a group of 50 cases treated by residents in the orthodontic department at the
university at buffalo
complex and rapid scientific and technological advances have made it difficult for dental practitioners to stay current in one field let alone more than one an interdisciplinary approach is necessary for best utilizing new and existing techniques to decrease practitioner frustration and increase patient benefits
