Computation, Dynamics, and Cognition 2013-12-26

Currently, there is growing interest in the application of dynamical methods to the study of cognition. Computation, Dynamics, and Cognition investigates this convergence from a theoretical and philosophical perspective, generating a provocative new view of the aims and methods of cognitive science. Advancing the dynamical approach as the methodological frame best equipped to guide inquiry in the field, two main research programs—the symbolic and connectionist approaches—are discussed. Marco Giunti engages a host of questions crucial not only to the science of cognition but also to computation theory. Dynamical systems theory, philosophy of mind, and philosophy of science are discussed. In Chapter One, Giunti employs a dynamical viewpoint to explore foundational issues in computation theory. Using the concept of Turing computability, he precisely and originally defines the nature of a computational system, sharpening our understanding of computation theory and its applications. In Chapter Two, he generalizes his definition of a computational system, arguing that the concept of Turing computability itself is relative to the kind of support on which Turing machine operate. Chapter Three completes the book’s conceptual foundation by discussing a form of scientific explanation for real dynamical systems. Giunti calls Galilean explanation. The book’s fourth and final chapter develops the methodological thesis that all cognitive systems are dynamical systems on Giunti’s view. A dynamical approach is likely to benefit even those scientific explanations of cognition that are based on symbolic models. Giunti concludes by proposing a new modeling practice for cognitive science, one based on Galilean models. Lucidly written and broad-ranging in its analysis, Computation, Dynamics, and Cognition will interest philosophers of science and mind as well as computational theorists.
