Global Satellite Meteorological Observation (GSMO) Theory 2012-08-21 a biologically striking and clinically important
feature of viruses is their rapid evolutionary dynamics in nature the continual interactions between viruses and host
organisms promote quick changes in virus populations eventually leading to co evolution of viruses and hosts for their
survival the structural and functional information on the interactions between viruses and hosts should provide a
molecular and biological basis to understand infection replication cell host tropism immune escape pathogenesis and
direction of evolution of viruses the information is also essential to develop methods to control transmission and replication of pathogenic viruses however the integrated information on the structure function and evolution of viruses and hosts has remained poorly accumulated partly due to the limitation of analytical methods recent progress in genome science and computational approach may open up a new avenue of research of the interactions between viruses and hosts by integrating information on the structures functions and evolution in this research topic we welcome papers concerning the computer assisted structural and functional studies based on genomic information with theoretical or in combination with experimental approaches for understanding molecules infection replication cell host tropism immune escape pathogenesis and evolution of viruses in nature
