Activity based costing solutions

Time-driven Activity-based Costing

2007

in the classroom activity based costing abc looks like a great way to manage a company's limited resources but executives who have tried to implement abc in their organizations on any significant scale have often abandoned the attempt in the face of rising costs and employee irritation. Time driven activity based costing is the solution to the problems associated with large scale abc implementation. In this book, Kaplan and Anderson offer a revised model where managers can estimate the resource demands imposed by each transaction, product, or customer rather than rely on time consuming and costly employee surveys. In their new model, Kaplan and Anderson focus on the two parameters managers need to estimate how much it costs per time unit to supply resources to the business activities the total overhead expenditure of a department divided by the total number of minutes of employee time available and how much time it takes to carry out one unit of each kind of activity as estimated or observed by the manager. Rather than endlessly updating and maintaining abc data, this book will allow managers to spend their time addressing the deficiencies the model reveals: inefficient processes, unprofitable products and customers, and excess capacity. Kaplan and Anderson lead the discussion of time driven abc in the first seven chapters followed by individual case studies of actual implementations by Acorn consultants in diverse settings.

dr geiger's research proposes innovative and practical responses to the cost war fought by government organizations struggling with lower budget levels. His sustained research contributions into the measurement and management of cost in government organizations promise to improve governments' mission effectiveness by improving its mission efficiency. Association of government accountants as the United States moves from cold war to cost war, the management of cost has greatly increased in importance. In fact, the greatest threat today to the strength of the nation may be poor management of the limited remaining resources. Winning the cost war documents a new doctrine of cost management developed from battlefield management, one of management's oldest applications. Dale Geiger defines and illustrates new ideas for everything from managerial cost accounting to analysis and accountability. Winning the cost war has moved managerial costing from being a secondary chore to a framework for success in today's environment. A must-read for agency and corporate leaders who need to adopt battlefield instincts of strategy and tactics and apply them in the new fiscal war.

it is clear that our environment is changing and not for the better companies cannot ignore environmental issues anymore public awareness is growing legislation is tightening and demand for iso 14000 compliance is rising for many however the field of environmental management including iso 14000 is full of unfamiliar terms high learning curves unproductive approaches much frustration and often little action if environmental management is to become widely accepted and self motivated in industry it must connect to the basic motivators for business increased competitiveness and profitability activity based cost and environmental management a different approach to the iso 14000 compliance demonstrates how environmental assessment and management can be performed based upon familiar principles cost accounting and cost management specifically this book describes how the well established activity based costing and management principles can be extended with non monetary environmental dimensions the result is a single integrated framework called activity based cost and environmental management that provides the tools and abilities to do both environmental management and cost management in an integrated
manner and according to modern management principles this integration of economic and environmental dimensions based upon familiar cost accounting and management principles makes it easier for decision makers to not only include the environment in their decision making but also to identify rank and prioritize opportunities for win win situations where competitiveness is increased and environmental impact reduced at the same time in this book the basic concepts of activity based cost and environmental management are described as well as how to make your own integrated activity based cost and environmental management implementations and how to get the most out of them using uncertainty distributions monte carlo simulations and sensitivity charts among others the book includes chapters on environmental management and activity based costing as well as several real life case studies from companies for which the authors implemented activity based cost and environmental management systems

Life cycle cost models for green buildings with optimal green star credits illustrates the tools and methods for developing a life cycle cost model that incorporates developer constraints while maximizing the number of credit points achieved. The book identifies the interdependencies among various credits in the green star environmental rating system. Afterwards, life cycle cost is calculated by considering six main central business districts (CBDs) of Australia. The net present value (NPV) technique is used to calculate life cycle costs. Further, a sensitivity analysis is also carried out for selected credits to identify the changes to life cycle cost due to changes in discount rate. Once all life cycle cost data is calculated, this book illustrates the development of the proposed model using a Java application which allows users to evaluate each key criterion of green buildings separately. The book is designed to provide ample knowledge of the various options available to get green building certification and the further implications in terms of life cycle cost saving and management advice for keeping a green building project operating on time and budget throughout their life cycle.

going to the bottom of the bottom line traditional cost management systems typically defeat their own purpose by leading corporations to make decisions that ultimately do not optimize performance these systems are the foundation for decisions that are made throughout the corporation in order for organizations to increase performance beyond current capabilities a new approach is needed that addresses issues such as understanding the true impact of various actions on the bottom line and eliminating methods that distort numbers and narrow options explicit cost dynamics ecd offers such an alternative and this expertly written revolutionary book provides an indispensable introduction to the subject informative and easy to read explicit cost dynamics provides an alternative view and understanding of the impact of costs actions and time on the bottom line of a corporation explains how this new theory can lead to an overall profit maximization shows that costs can be considered as either a function of activities performed as a function of

while the weight of a structure constitutes a significant part of the cost a minimum weight design is not necessarily the minimum cost design little attention in structural optimization has been paid to the cost optimization problem particularly of realistic three dimensional structures cost optimization is becoming a priority in all civil engineering projects and the concept of life cycle costing is penetrating design manufacturing and construction organizations in this groundbreaking book the authors present novel computational models for cost optimization of large scale realistic structures subjected to the actual constraints of commonly used design codes as the first book on the subject this book contains detailed step by step algorithms focuses on novel computing techniques such as genetic algorithms fuzzy logic and parallel computing covers both allowable stress design asd and load and resistance factor design lrfd codes includes realistic design examples covering large scale high rise building structures presents computational models that enable substantial cost savings in the design of structures fully automated structural design and cost optimization is where large scale design technology is heading thus cost optimization of structures fuzzy logic genetic algorithms and parallel computing will be of great interest to civil and structural engineers mechanical engineers structural design software developers and architectural engineers involved in the design of structures and life cycle cost optimisation it is also a pioneering text for graduate students and researchers working in building design and structural optimization

cost is considered a crucial factor in much decision making in private and public organisations therefore the ability to calculate total estimated costs for different alternatives is important however such total cost analysis is a challenging task providing students with the knowledge and skills needed for total cost analysis is therefore relevant in several disciplines within higher education within logistics management total cost analysis is for decades by several scholars regarded as a cornerstone a fundamental part of the discipline however except for describing the basic steps and presumptions the literature does not give much support concerning how to conduct such analyses or which the difficulties associated with total cost analysis are this blank space in literature is not limited to the logistics discipline it stretches throughout many disciplines neither does literature cover how to teach to support students learning of total cost analysis hence to address the lack of research the purpose of this thesis was formulated as follows to contribute to the understanding
of conducting learning and teaching total cost analysis three research questions were shaped to address each part of the purpose conducting learning and teaching rq1 what challenges are connected to the process of conducting total cost analysis rq2 what thresholds are there for learning how to conduct total cost analysis rq3 how can total cost learning be supported by suitable educational methods the research questions are connected to each other in the sense that the challenges of conducting total cost analysis rq1 indicate within which areas total cost learning is difficult and thereby where thresholds are to be investigated rq2 further knowledge about the learning thresholds is needed to discuss suitable educational activities rq3 the research was conducted by a combination of literature reviews and multiple case studies at four higher education institutions where both teachers and students were approached the findings for rq1 were developed in an abductive procedure walking back and forth between literature and cases a twelve step process for total cost analysis was defined and specific challenges associated for each of these steps regarding learning thresholds rq2 perceived difficulties with learning total cost analysis were identified in the case studies these difficulties were then analysed against threshold characteristics available in literature this resulted in the identification of four total cost learning thresholds literature on constructivist based teaching was used to suggest teaching methods to support learning rq3 these types of activities proved to match the ones most appreciated by teachers and students in the studied cases the twelve step process provides a more structured and holistic view of total cost analysis than previously available in the logistics literature the description of challenges with conducting total cost analysis is novel not only within logistics but also generally why this is a major contribution from this research aspects regarding teaching and learning connected to logistics and to total cost analysis are very sparsely addressed in literature which makes the findings concerning learning thresholds and teaching methods valuable the findings are believed to be useful for different stakeholders first and foremost teachers can use the findings for designing programs courses and course modules which cover the important aspects of total cost analysis with help from educational activities supporting the students learning second for organisations where total cost analyses are conducted the suggested process with its steps and associated challenges can be used to achieve better total cost analyses and in turn
more substantiated decisions in the longer perspective better education on total cost analysis at higher education institutions will further strengthen the total cost competence in organisations thereby improving the total cost related decision making total cost analysis is not unique for the logistics discipline although focus in the study has been on higher education institutions providing logistics courses the findings are to a high extent believed to be relevant also for other disciplines dealing with total cost analysis
