psychosomatic diseases are a group of diseases closely related to psychosocial factors but mainly manifested by somatic symptoms involving respiratory digestive endocrine and other systems as a result the lack of consensus on its diagnosis has plagued clinical treatment in internal medicine surgery and psychiatry for decades in recent years research on the pathogenesis of psychosomatic diseases has made significant progress for example franz alexander believes that unresolved subconscious conflicts are the main cause of psychosomatic disorders the subconscious psychological conflict is caused by the changes in the functional activities of the autonomic nervous system acting on the corresponding special organs and patients with susceptible qualities similarly mental and psychological factors affect gastrointestinal sensory and motor functions through the autonomic nervous system brain gut axis and neuroendocrine system meanwhile gastrointestinal symptoms also affect emotions and behaviors through the brain gut axis in addition the cannon bard theory of emotional physiology and pavlovian theory of higher neural activity types from quantitative research methods to study the relationship between conscious psychological factors such as emotions and measurable physiological and biochemical changes in clinical work the treatment of psychosomatic diseases has gradually shifted from emphasizing physical treatment to comprehensive treatment principles that is taking into account the psychological and behavioral aspects of the physical treatment of the primary disease the main purpose of physical treatment of the primary disease is to control or relieve symptoms to consolidate the treatment of psychosomatic diseases and reduce the recurrence of psychosomatic diseases combining physical therapy with necessary psychotherapy would potentially obtain a more comprehensive curative effect

This research topic is the fourth volume of the series Clinical application of artificial intelligence in emergency and critical care medicine. Volume I Clinical application of artificial intelligence in emergency and critical care medicine, Volume II Clinical application of artificial intelligence in emergency and critical care medicine, and Volume III Clinical application of artificial intelligence in emergency and critical care medicine, collectively explore how analytics based on artificial intelligence has greatly advanced scientific research fields like natural language processing and imaging classification. Clinical research has also greatly benefited from artificial intelligence, with emergency and critical care physicians facing patients with rapidly changing conditions that require accurate risk stratification and initiation of rescue therapy. Furthermore, critically ill patients such as those with sepsis, acute respiratory distress syndrome, and trauma are comprised of heterogeneous populations. The one-size-fits-all paradigm may not fit for the management of such heterogeneous patient populations, and artificial intelligence can be employed to identify novel subphenotypes of these patients. These subclassifications can provide not only prognostic value for risk stratification but also predictive value for individualized treatment. With the development of transcriptome, artificial intelligence can greatly help to identify useful information from high-dimensional data. Altogether, it is of great importance to further utilize artificial intelligence in the management of critically ill patients.
