Many contemporary neuropsychology texts focus on neuropathology, the description of specific tests and the differential diagnosis of central nervous system disorders. However, increasingly sophisticated neuroradiological techniques, managed care factors and the growth of rehabilitation necessitates that rehabilitation professionals provide more functionally versus diagnostically useful evaluations to improve the neuropsychological functioning and community integration of persons with brain injuries or diseases. This book aims to fill this gap and to provide an overview of standard neuropsychological treatment strategies for specific cognitive impairments that are identified on testing. The new edition enhances this goal with three chapters outlining important recommendations and issues for rehabilitation professionals written by a team of experienced scientists and professionals. The volume provides a universal taxonomy of neuropsychological abilities emphasizing relatively simple terms with a list of basic rehabilitation strategies to improve impairments identified in general cognitive domains. Specific chapters are included on the neuropsychological remediation of memory, attention, language, visual spatial skills, and executive function impairments. Each chapter proposes a taxonomy of relatively unitary cognitive constructs, e.g., divided attention, sustained attention, focused attention. Attention lists tests which may be used to assess each construct and provides specific rehabilitation strategies to improve or accommodate the identified neuropsychological impairments. The final chapters cover basic resources and issues of which the rehabilitation professional needs to be aware, vocational rehabilitation, disability determination, and guardianship issues. This new edition provides a wealth of useful information for family members, rehabilitation professionals, and others who work with persons with brain injury in improving the community functioning for those with brain dysfunction. An accompanying website facilitates access to the resources and strategies from the book allowing the practitioner to cut and paste these recommendations into their clinical reports.

This edited collection is the first complete guide for rehabilitation professionals seeking to engage a whole person, biopsychosocial, and mind body medicine integrated approach to care. Drawing on the foundations of integrative medicine, integrative rehabilitation practice (IRP) goes beyond the treatment of symptoms to explore multiple levels, roots, and possible contributing factors to individual’s health experience. IRP acknowledges the complex inseparability of biological, behavioral, psychosocial, spiritual, and environmental influences. The book covers both the theoretical foundations of IRP and applications to practice in the fields of physical therapy, occupational therapy, yoga therapy, speech and language therapy, and many other professions. Featuring contributions from Matthew J Taylor, Marlysa Sullivan, Andra Devoght, and other professionals, case studies, storytelling, and reflective exercises, this cross-disciplinary clinical training guide is essential reading for all rehabilitation professionals as well as others interested in advancing whole person care.

the fourth edition of quick reference neuroscience continues to meet a need in the rehabilitation professions that has gone unfilled the availability of a source that simplifies and thoroughly breaks down neuroscience information into the essential principles that can be used to understand neurological conditions and principles underlying rehabilitation evaluation and practice although many excellent textbooks exist that provide exhaustive neuroscience information much of that information may be extraneous to a practicing therapist who needs to quickly review a specific neuroscience concept to better explain that information to a patient or it may be
extraneous to a student needing to learn the critical neuroscience principles supporting a specific rehabilitation intervention we are all on information overload and need resources that quickly but fully provide condensed information in a user friendly easy to use format the discipline of neuroscience has exploded in the past 2 decades as imaging technologically has facilitated knowledge of the brain in ways previously unimaginable much of this newly gained knowledge of brain function relates to molecular and cellular levels levels of brain analysis of which highly competent rehabilitation therapists do not require in depth understanding in fact much of the molecular and cellular understanding of brain function is not directly used by therapists to treat patients in clinical rehabilitation settings while it is important to have some understanding of the cellular brain processes underlying behavior our need as rehabilitation professionals to use this information in practice is not the same as that of a neurologist neurosurgeon or neuropathologist rehabilitation practitioners are under overwhelming productivity demands for patient care and for evidence dissemination ie reading journal articles and using relevant research evidence in practice students in rehabilitation health care programs are similarly under tremendous pressure to master a large body of relevant coursework and fieldwork education in a limited amount of time it seems imprudent to further add to student and practitioner requirements the need to memorize cellular neuroscience information that will not be used in practice new to this edition are examples of occupational performance implications occupational performance implications illustrate how neurological dysfunction translates into problems in the participation of daily life activities problems in the performance of daily life activities are the primary concern of rehabilitation professionals whose role it is to help people engage in desired daily life activities despite the presence of illness disability or injury this edition also provides the full screening methods for such things as cranial nerve testing and deep tendon reflex testing
